The device I chose was a slow cooker. This device is a electronic pot. This pot has metal around the sides and a sturdy base and top with makes it safe as possible. Near the middle there is a keyboard and can also be called with a various number of buttons which consist of many actions and usually has a screen with LED light to represent the actions.

This device accepts only actions posed by the buttons such as options and modes that are available to use.These buttons also trigger many other functions to help you with what you need.

These contraptions are meant to cook and have many ways to process data which makes it a very efficient tool. They process this data through buttons which create commands to do things and ways to cook.

The result of this processing will lead to cooking. This contraption will cook uncooked to cooked this is the end result of this processing.
